A DIGITAL APP TO ELIMINATE MALNUTRITION IN CHILDREN LIVING WITH HIV AND TB

TECHNOLOGY HAS A VITAL ROLE IN REACHING THE WORLD’S MOST VULNERABLE POPULATIONS.

SCOPE CODA merges identity management with programme management to provide front-line workers in the deep field without connectivity with the tools to improve nutrition and health programming. Once connected, it creates a unified information system, so that all partners can improve programmes and plan together. The system reduces errors, increases programme efficiency, and improve nutritional and health outcomes of treatment clients. Funds raised here will be directed towards mother and child health and nutrition (MCHN) services for children under five, as well as people living with HIV and tuberculosis.

In early 2018, SCOPE CODA was piloted in Uganda and South Sudan followed by a stock-taking and learning exercise to improve the application. There will be a steady roll-out of the use of SCOPE CODA to fourteen other high-profile countries in East and Southern Africa over two years, as a premier tool to improve malnutrition, HIV and TB treatment and work towards the goal of ending AIDS by 2030.
